

Metal Industry Indicators

Indicators of Domestic Primary Metals, Steel, Aluminum, and Copper Activity

July 2011

The primary metals leading index decreased for the second consecutive month in June, and its 6-month smoothed growth rate, which has been decreasing since the start of this year, also declined. However, the growth rate remains above the threshold that suggests activity growth in the primary metals industry. The manufacturing sector will likely continue to underpin the U.S. metals industry. The metals price leading index decreased in May, but its growth rate stayed in positive territory, suggesting price growth for some metals in the near future.

The **primary metals leading index** decreased 0.8% to 155.2 in June from a revised 156.5 in May. The index's 6-month smoothed growth rate, a compound annual rate that measures the near-term trend decreased to 4.2% from a revised 6.7% in May. A growth rate above +1.0% is usually a sign of an upward near-term trend for future metals activity, while a growth rate below -1.0% indicates a downward trend. For an explanation of these indexes and a definition of the primary metals industry, [see page 10](#).

Three of the index's four available components decreased in June, and one increased. A sharp decline in the stock price index combining construction and farm machinery companies and industrial machinery companies made the largest negative contribution, -1.0 percentage point, to the net decrease in the leading index. The average workweek in primary metals establishments, which has increased more than 1 hour since the start of the year, shortened slightly in June and contributed -0.2 percentage points to the leading index. The decline in the USGS metals price index growth rate slowed in June to the point that its negative contribution rounded to zero. In contrast, the Institute for Supply Management's PMI made the only positive contribution, 0.4 percentage points, to the leading index. The PMI remains above the threshold that denotes an increase in future manufacturing activity. The primary metals leading index will likely be revised next month when the remaining four components become available.

The positive primary metals leading index growth rate suggests that growth in metals industry activity will continue. The manufacturing sector has been hindered by the disruption in the supply chain for automotive parts from Japan in recent months, but now appears to be picking up speed and increasing metals demand. The housing industry could generate additional metals consumption as the demand for rental apartments in the United States increases construction activity. Global metals consumption is high, particularly in Asia, and supply shortages are looming. This is likely to support, at least, modest U.S. metals activity growth.

The **steel leading index** decreased 1.0% in May, the latest month for which it is available, to 111.6 from a revised 112.7 in April. Its 6-month smoothed growth rate decreased to 2.3% from a revised 4.4% in April. Movement among its indicators was mixed, but the dip in the PMI had the most negative impact on the leading index. A drop in car and light truck sales, which was likely caused by the disruption in parts and supplies from Japan, and the falling S&P stock price index for iron and steel companies also made sizable negative contributions to the leading index. In contrast, the rising index for new housing permits offset some of those declines in May. The positive steel leading index growth rate is still indicating that growth in the U.S. steel industry could continue in the near term.

The **copper leading index** edged down 0.2% to 120.9 in May, from a revised 121.1 in April. Its 6-month smoothed growth rate remained at its revised April level of 2.7% in May. A one-half hour shorter average workweek in nonferrous metal products, except aluminum, plants accounted for most of the decrease in the leading index. A tighter yield spread between the U.S. 10-year Treasury note and the federal funds rate also had a strong negative pull. However, the index for new housing permits boosted the copper leading index. This is the third month that the copper leading index growth rate has been above the threshold that indicates higher future activity growth. This suggests that the recovery in the U.S. copper industry could continue in the near term.

Robust Asian Demand Buoy Metal Prices

The **metals price leading index** decreased 0.8% in May, the latest month for which it is available, moving to 109.4 from 110.3 in April, and its 6-month smoothed growth rate declined to 2.0% from a revised 3.2% in April. Three of its four components decreased in May. The growth rate of the Organization for Economic Cooperation and Development (OECD) Total Leading

Index slipped into negative territory for the first month since June 2009, pointing to decreased growth in many countries. It made the largest negative contribution, -0.4 percentage points, to the net decrease in the metals price leading index. The yield spread between the U.S. 10-year Treasury note and the federal funds rate tightened in May and pulled the index down another 0.4 percentage points. The growth rate of the trade-weighted average exchange value of other major currencies against the U.S. dollar decreased for the first month this year, contributing -0.3 percentage points. In contrast, a rise in the growth rate of the inflation-adjusted value of new orders for U.S. nonferrous metal products buoyed the index by 0.2 percentage points. The metals price leading index signals major changes in the growth rate of nonferrous metals prices an average of 8 months in advance.

The growth rate of the inflation-adjusted value of U.S. nonferrous metal products inventories, which is an indicator of supply and moves inversely with the price of metals, moved higher in May. However, the inventories growth rate is still negative and is suggesting that prices could rise. Concern over economic conditions in the United States and Europe is placing downward pressure on metal prices; however, China's metals demand could buoy prices in the near term.

The business cycle and inventories are only two factors in metal price determination. Other factors that affect prices include changes in metals production, strategic stockpiling, foreign exchange rates, speculation, and production costs.

Note: The components of the Leading Index of Metal Prices are the spread between the U.S. 10-year Treasury Note and the federal funds rate, and the 6-month smoothed growth rates of the deflated value of new orders for nonferrous metal products, the Organization for Economic Cooperation and Development (OECD) Total Leading Index, and the reciprocal of the trade-weighted average exchange value of the U.S. dollar against other major currencies. The Metal Industry Indicators (MII) Nonferrous Metals Price Index measures changes in end-of-the-month prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange (LME). The steel scrap price used is the price of No. 1 heavy melting. Inventories consist of the deflated value of finished goods, work in progress, and raw materials for U.S.-produced nonferrous metal products (NAICS 3313, 3314, & 335929). Six-month smoothed growth rates are based on the ratio of the current month's index or price to its average over the preceding 12 months, expressed at a compound annual rate.

Coincident: 1, Federal Reserve Board; 2, Bureau of Labor Statistics and U.S. Geological Survey; 3, U.S. Census Bureau and U.S. Geological Survey. All series are seasonally adjusted, except 2, 3, and 4 of the leading index.

NA: Not available **r:** Revised

Note: A component's contribution, shown in Tables 3, 5, 7, and 9, measures its effect, in percentage points, on the percent change in the index. Each month, the sum of the contributions plus the trend adjustment equals (except for rounding differences) the index's percent change from the previous month.

CHART 6.
COPPER: LEADING AND COINCIDENT INDEXES, 1989-2011

CHART 7.
COPPER: LEADING AND COINCIDENT GROWTH RATES, 1989-2011

Explanation

Each month, the U.S. Geological Survey tracks the effects of the business cycle on five U.S. metal industries by calculating and publishing composite indexes of leading and coincident indicators. Wesley Mitchell and Arthur Burns originated the cyclical-indicators approach for the economy as a whole at the National Bureau of Economic Research in the mid-1930s. Over subsequent decades this approach was developed and refined, mostly at the National Bureau, under the leadership of Geoffrey H. Moore.¹

A business cycle can briefly be described as growth in the level of economic activity followed by a decline succeeded by further growth. These alternating periods of growth and decline do not occur at regular intervals. Composite indexes, however, can help determine when highs and lows in the cycle might occur. A composite index combines cyclical indicators of diverse economic activity into one index, giving decision makers and economists a single measure of how changes in the business cycle are affecting economic activity.

The indicators in the metal industry leading indexes historically give signals several months in advance of major changes in a coincident index, a measure of current metal industry activity. Indicators that make up the leading indexes are, for the most part, measures of anticipations or new commitments to various economic activities that can affect the metal industries in the months ahead.

Composite coincident indexes for the metal industries consist of indicators for production, shipments, and total employee hours worked. As such, the coincident indexes can be regarded as measures of the economic health of the metal industries.

The metal industry coincident indexes reflect industry activity classified by the U.S. Standard Industrial Classification (SIC) and the North American Industry Classification System (NAICS). Of the five metal industries, primary metals (NAICS 331) is the broadest, containing 25 different metal processing industries. Steel, aluminum, and copper are specific industries within the primary metals group.

The SIC was the main vehicle used by the U.S. Government and others in reporting industry economic statistics throughout most of the last century. Starting with the 1997 U.S. Economic Census, the U.S. Government began using the NAICS, which classifies economic data for industries in Canada, Mexico, and the United States. In general, metal industry indexes starting in 1997 begin to reflect the NAICS classification, while indexes for earlier years follow the SIC. Hence, composite indexes from 1997 forward are not entirely consistent with those of earlier years.

The largest change to primary metals because of the NAICS deals with other communication and energy wire manufacturing (NAICS 335929). Under NAICS, this manufacturing has been removed from primary metals and added to electrical equipment, appliance, and component manufacturing. Because monthly shipments and new orders for this wire are not available, the USGS is estimating their values from 1997 onward and adding them to the appropriate metal industry indicators and indexes to maintain consistency.

¹Business Cycle Indicators, A monthly report from The Conference Board (March 1996).

There are other small changes to the primary metals industry because of the switch to the NAICS. Coke oven activity not done by steel mills, for example, is removed and alumina refining, a part of industrial inorganic chemical manufacturing under the SIC, is added. Since the historic trends of the composite indexes are not affected by these small changes, the USGS is not making specific adjustments to the indexes for them for the periods before and after 1997.

The metal industry leading indexes turn before their respective coincident indexes an average of 8 months for primary metals and 7 months for steel and copper. The average lead time for the primary aluminum leading index is 6 to 8 months, and the average lead time for the aluminum mill products leading index is 6 months.

The leading index of metal prices, also published in the *Metal Industry Indicators*, is designed to signal changes in a composite index of prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange. On average, this leading index indicates significant changes in price growth about 8 months in advance.

The growth rate used in the *Metal Industry Indicators* is a 6-month smoothed growth rate at a compound annual rate, calculated from a moving average. Moving averages smooth fluctuations in data over time so that trends can be observed. The 6-month smoothed growth rate is based upon the ratio of the latest monthly value to the preceding 12-month moving average.

$$\left[\left(\frac{\text{current value}}{\text{preceding 12-month moving average}} \right)^{\frac{12}{6.5}} - 1.0 \right] * 100$$

Because the interval between midpoints of the current month and the preceding 12 months is 6.5 months, the ratio is raised to the 12/6.5 power to derive a compound annual rate.

The growth rates measure the near-term industry trends. They, along with other information about the metal industries and the world economy, are the main tools used to determine the outlook of the industries. A 6-month smoothed growth rate above +1.0% usually means increasing growth; a rate below -1.0% usually means declining growth.

The next update for these indexes is scheduled for release on the World Wide Web at 10:00 a.m. EDT, Friday, August 19. The address for *Metal Industry Indicators* on the World Wide Web is: <http://minerals.usgs.gov/minerals/pubs/mii/>

The *Metal Industry Indicators* is produced at the U.S. Geological Survey by the National Minerals Information Center. The report is prepared by Gail James (703-648-4915; e-mail: gjames@usgs.gov) and Ken Beckman (703-648-4916; e-mail: kbeckman@usgs.gov). The former Center for International Business Cycle Research, under the direction of Dr. Geoffrey H. Moore, and the former U.S. Bureau of Mines developed the metal industry leading and coincident indexes in the early 1990s. Customers can send mail concerning the *Metal Industry Indicators* to the following address:
